Objectives and scope of the benchmarking study
Objectives and scope of the benchmarking study

The **primary objective of the study that Febeliec requested from Deloitte** is to obtain an overview of possible **price differences for electricity** purchased on the electricity market by major industrial consumers in Belgium, such as the members of Febeliec, as compared to their peers in France, the Netherlands and Germany.

- The **primary focus** is on **relative price differences** that exist on the market for Febeliec member profiles using identical, simplified, standardized, load (baseload and peak load) and volume profiles (ranging from 100 GWh to 1000 GWh).

- The **study covers** the actual prices for electricity that can be purchased in the relevant electricity markets in the **period 2016, 2017 and 2018** based on existing legislation and policies.
Benchmark methodology
Benchmark methodology

The relevant electricity price components used in this study are based solely on public data sources.

**Market price:**

Market prices are based on electricity market quotations (using appropriate combinations of spot & forward prices) as to obtain objective data that is comparable over the different Febeliec members.

This pricing approach neutralizes the impact of:

- Different sourcing and hedging strategies
- Historical long term sourcing contracts concluded under different market conditions

**Network costs:**

Network costs are regulated tariffs applied by the transmission grid operators (TSOs) for the transport of electricity over the transmission network (excluding distribution).

**Electricity taxes:**

Represent all taxes and other levies that are to be paid on top of the market price and network costs in the different jurisdictions.
Results of the benchmarking study

Baseload profile
Results of the benchmarking study

Baseload profile

- Benchmark all-in electricity prices of a **baseload profile**

- Comparative overview of:
  - Market prices
  - Network costs
  - Electricity taxes
Benchmark all-in electricity prices

Baseload profile

Large industrial baseload consumers are facing higher all-in prices for electricity purchased in Belgium versus in its neighboring countries.

- In 2018, we observe all-in electricity prices ranging from 41€/MWh in Germany to 62€/MWh in Flanders and up to 71€/MWh in Wallonia for a 100GWh baseload consumer.

- In Flanders, results show a difference in electricity price of approximately 5€/MWh (+10,5%) for a 1000GWh industrial consumer up to 9€/MWh (+17%) for a 100GWh industrial consumers compared to the average of the electricity prices of all countries in scope of the study. In Wallonia, we see differences of approximately 6€/MWh (+14%) for a 1000GWh industrial consumer up to 18€/MWh (+34%) for a 100GWh industrial consumer compared to the average of the electricity prices of all countries in scope of the study.

- For a 100 GWh baseload consumer, this represents an annual all-in electricity cost difference of 0,9 million € in Flanders and 1,8 million € in Wallonia (compared to the average of the countries in scope).

- For a 1000 GWh baseload consumer this represents an annual all-in electricity cost difference of 4,7 million € in Flanders and 6,4 million € per year in Wallonia (compared to the average of the countries in scope).
The all-in electricity prices have increased in Belgium in 2018 compared to 2017. For Flanders we see an increase in all-in electricity prices of +1% up to +5% and for Wallonia we see an increase of +5%.

This increase is partially explained by an increasing commodity cost (+5%). Network costs have also increased (+1% to +2%), both in Flanders and in Wallonia. Taxes in Wallonia have increased (with up to 10%). In Flanders, taxes for voltage levels above 70kV have increased (with up to 11%) while taxes for voltage levels up to 70 kV have decreased (with up to 10%).

The observed price difference with the other countries is essentially driven by a combination of the following elements:

- **Substantially higher electricity taxes** in Flanders and Wallonia compared to the neighboring countries. Taxes are higher compared to all neighboring countries, both in Flanders and in Wallonia. Up to 70kV, taxes are up to 35% higher in Flanders and up to 61% higher in Wallonia compared to the average of all jurisdictions in scope. Above 70kV, taxes are up to 37% higher in Flanders and up to 55% higher in Wallonia compared to the average of all jurisdictions in scope.

- **Important discounts on network costs** in France, Germany and the Netherlands of up to 90% of the standard tariffs for certain consumption profiles. More details can be found in the appendix to this report.

- **Commodity prices** in Flanders & Wallonia are about 5% higher than the average commodity cost for all countries in scope.
The wholesale electricity prices in Germany remain substantially below the market prices in the other countries in the benchmarking scope.

For 2018, Belgian market prices are nearly in line with market prices in France, but remain 7% more expensive than market prices in the Netherlands and 22% more expensive than market prices in Germany.
Comparative overview of network costs

Baseload profile

Network tariffs in Belgium increased (+1% to +2%) in 2018 and remain higher than those in the neighboring countries.

In France, Germany and the Netherlands, a maximum 90% discount on network costs is applicable for certain consumption profiles. This discount does not exist in Belgium, which explains the large differences between Belgium and its neighboring countries. More details can be found in the appendix to this report.
Comparative overview of electricity taxes

Baseload profile

Taxes in Belgium remain higher compared to the neighboring countries. Taxes increased in 2018 in Flanders and Wallonia, compared to 2017, with the exception of taxes in Flanders for up to 70kV. The increase was up to 12% for consumers connected to 150kV or above in Flanders, while the increase is up to 10% for consumers connected to 150kV or above in Wallonia.

In France, industrial consumers benefit from low electricity taxes. Electricity taxes in France are up to 87% lower than the average of the countries in scope of the study.

Also in the Netherlands, electricity taxes are up to 74% lower than the average of Belgium and its neighboring countries.

Results of the benchmarking study

Peak load profile
Results of the benchmarking study

Peak load profile

• Benchmark all-in electricity prices of a peak load profile

• Comparative overview of:
  - Market prices
  - Network costs
  - Electricity taxes
For 2018, we observe all-in peak load prices ranging from **54€/MWh** in the Netherlands for a 1000 GWh consumer to nearly **82€/MWh** in Germany and Wallonia for a 100 GWh consumer.

The all-in electricity price for peak load consumers in Wallonia is **6,5 €/MWh (+9,5%)** higher for a 100 GWh consumer compared to the average prices for their peers in Flanders, France, the Netherlands and Germany.

For a 100 GWh consumer in Wallonia this represents a price impact of **0,6 million €** in 2018 compared to the average of the countries in scope of the study.

Prices in Flanders are slightly below the average of the other countries in the benchmark study. Prices in Flanders are between **10%** (for 1000GWh) and **13%** (for 100GWh) higher compared to the Netherlands.

The impact of this price difference between Flanders and the Netherlands is **0,8 million €** for a 100GWh consumer and **5,7 million €** for a 1000GWh consumer.
The all-in electricity prices have slightly increased in Belgium in 2018 compared to 2017 for almost all consumer profiles. For Wallonia we see an increase of +2%. For Flanders we see an increase in all-in electricity prices of +2% above 70kV and a decrease of less than 1% for up to 70kV.

This increase is explained by an increasing commodity cost (+1%) and an increase in network costs (up to 1.6%) in both regions.

The observed price difference with the other countries is essentially driven by a combination of the following elements:

- **Commodity prices** in Flanders & Wallonia are 5% higher than the average commodity cost for all countries in scope.

- **Substantially higher electricity taxes** in Flanders and Wallonia compared to the neighboring countries. Up to 70kV, both in Flanders and Wallonia taxes are higher compared to all neighboring countries. In Flanders, taxes are up to 34% higher compared to the average of all jurisdictions in scope. In Wallonia, taxes are up to 60% higher compared to the average of all jurisdictions in scope. Above 70kV, taxes are up to 38% higher in Flanders and up to 50% higher in Wallonia compared to all neighboring countries (for a 300GWh consumer).
Comparative evolution of commodity prices
Peak load profile

The wholesale electricity prices for peak load in Germany and the Netherlands remain substantially below the market prices in the other countries in the benchmarking scope.

For 2018, Belgian market prices for peak load profiles are nearly in line with market prices in France, but remain 10% more expensive than in the Netherlands and nearly 20% more expensive than in Germany.
Comparative overview of network costs

Peak load profile

In **France, Germany and the Netherlands** industrial consumers with a peak load profile do not benefit from discounted network costs.

Network costs in Flanders and Wallonia are up to 64% lower (for a 100 GWh profile) than the average of the neighboring countries in scope of the study. It must be noted however, that the energy consumption is assumed to be constant throughout peak hours and that no power peaks occur, nor on a yearly, nor a monthly basis. Consumption profiles which do show these peaks, are paying additional network costs for this in Belgium.
Observations on taxes for peak load profiles are similar to those for baseload consumers, as most taxes depend on the total (yearly) energy consumption, rather than on the consumption profiles (baseload versus peak load). Only in France a slight difference is observed between taxes for baseload versus peak load consumers. This difference is related to the French Contribution Tarifaire d'Acheminement (CTA) that is function of the network costs that in turn depend on the subscribed capacity.

Appendices
Benchmark methodology

Market prices

The market prices used are based solely on publicly available data and have been consistently calculated in accordance with the following assumptions, validated and approved by Febeliec.

Use of market quotations:

• Market prices are calculated on a combination of spot and forward market prices whereby prices for Year N are determined as follows:
  
  o 50% of the commodity price is determined as the average of the (end of day) market prices for year ahead forwards over the period 1/1/N-1 to 31/12/N-1.
  
  o 35% of the commodity price is determined as the average of the (end of day) market prices for month ahead forwards over the period 1/12/N-1 to 30/11/N
  
  o 15% of the commodity price is determined as the average of the (end of) day ahead spot price for the period 31/12/N-1 to 30/12/N

• For 2018, the day-ahead and month-ahead components are based on available market data until 15/02/2018 and 12/02/2018, respectively. It is assumed that the day-ahead and month-ahead components throughout the rest of the year equal the average value of the period 01/01/2018 – 15/02/2018 and 01/01/2018 – 12/02/2018, respectively.
Benchmark methodology
Market prices

The following sources for market prices were used for the different jurisdictions:

- Flanders and Wallonia: EPEX Spot Belgium (day-ahead) and APX-ENDEX (month-ahead and year-ahead). As no peak load future prices are available for delivery on the Belgian Market, a proxy is used consisting of the adjusted average of future prices for delivery on the Dutch and French market. The adjustment consists of a factor representing the relation between forward baseload prices in Belgium compared to the respective forward baseload prices in France and the Netherlands.

- Netherlands: EPEX Spot Netherlands (day-ahead) and APX-ENDEX (month-ahead and year-ahead).

- France: EPEX Spot France (day-ahead) and EEX future prices (month and year ahead).

- Germany: EPEX Spot Germany (day-ahead) and EEX future prices (month and year ahead).
Benchmark methodology

Market prices

Use of regulated prices in France

• Industrial consumers in France have access to regulated wholesale electricity prices for their baseload consumption volumes (with a max threshold). In practice this means that the percentage of the power that can be sourced at such regulated tariffs heavily depends on the consumption profile of the consumer. Full baseload profiles will benefit the most. For peak load profiles, the benefit is rather limited.

• In 2016, these applicable regulated rates (based on “la Nouvelle Organisation du marché de l’électricité (La Loi NOME) and “L’Accès Régulé à l’Électricité Nucléaire Historique” (La Loi ARENH) have not been used in the model, as market prices decreased below regulated ARENH rates. For 2017 and 2018, this ARENH rate has been taken into account as market prices tended to be higher.

• As a result, market prices for France for 2016 have been determined completely in line with the approach as explained on the previous slide.

• For 2017 and 2018, market prices in France have been determined using the following combination of regulated and market prices:
  
  o For a baseload profile: 95% ARENH rates and 5% market quotations
  o For a peak load profile: 15% ARENH rates and 85% market quotations

• ARENH rates amount to 42 EUR/MWh for 2016, 2017 and 2018. In this study an increase of 0,5 EUR/MWh is added as a margin for the supplier.

• Market prices are determined as described in the previous page.
Benchmark methodology
Network costs

General

• Network costs relate to the regulated tariffs applied by the transmission grid operators (TSOs) for the transport of electricity over the transmission network. In order to determine benchmark rates, the following assumptions have been included as validated and approved by Febeliec:
  – Industrial consumers have a connection with ≥70 KV (no connection to the distribution network);
  – Consumers which consume less than 200GWh/year are assumed to be connected to the 70kV grid in Belgium or equivalent in the neighboring countries.
  – Consumers which consume more than 200GWh/year are assumed to be connected to the 150kV grid in Belgium or equivalent in the neighboring countries.
  – This is in line with the real connection level of most Febeliec members.
  – The subscribed capacity of the connection point was determined by adding a 10% contingency to the theoretical peak power levels;
  – The total energy taken off the grid on a yearly basis.
• It is assumed that no power peaks occur in the consumption profile, nor on a yearly, nor on a monthly basis. Consumption profiles which do show peaks, have to pay additional network costs for this in Belgium.
• Only fixed connection costs are included for one meter per access point. No additional fee or one-off costs are included for connection equipment (e.g. transformers, switches, ...).
• No additional costs are taken into account for excessive consumption of reactive energy, nor for exceeding the subscribed power.
• Peak hours are assumed to exist 5 days/week, 12 hours/day.
• No seasonal rates are applied.
Benchmark methodology

Network costs

Belgium
- For Belgium (where network losses are billed by the suppliers), a fee equal to 1.1% of the market price is added to the network tariff in order to ensure comparable rates with other countries in scope where network losses are part of the network tariff.

Germany
- For Germany the average of the rates of all 4 TSO’s active on the German territory are used.
- For Germany it is assumed that the full discount of 90% applies on the network costs
  - Exemption criterion is that the annual consumption ≥10GWh and that the threshold of 8000 consumption hours is exceeded

France
- The reduction in grid tariffs in France for certain energy intensive baseload consumers is included in the benchmark study for 2016, 2017 and 2018. For all years, the maximum reduction of 90% was assumed.
  - Exemption criterion is that the consumer is a baseload consumer ((> 7000 consumption hours AND annual consumption > 10GWh) OR (use rate during off-peak hours > 44% AND annual consumption > 20GWh) OR (use rate during off-peak hours > 40% AND annual consumption > 500GWh)) and specific energy consumption > 6kWh/€ added value and exposure to international competition > 25%

Netherlands
- For the Netherlands it is assumed that the full discount of 90% applies on the network costs
  - Exemption criterion is that the annual consumption ≥50GWh and that the threshold of 7446 consumption hours is exceeded
Benchmark methodology
Electricity taxes (1/2)

Electricity taxes relate to all taxes and other levies that are to be paid by the industrial electricity consumer in addition to market price and network costs. In order to determine benchmark rates, the following assumptions, which were validated and approved by Febeliec, have been included:

- VAT is not applied as it is not considered to be a cost element for these industrial consumers.
- For Flanders we assumed that 85% of the theoretical cost of green certificates (e.g. electricity produced by renewable solar power and cogeneration plants) is charged through by the supplier to the industrial consumer.
- For Flanders and Wallonia regional service obligations are due on the 30-70 kV network (and not on 150 kV).
- The Energy Fund Contribution, which was introduced in Flanders as from 2016 is only applicable up to 70kV and not on 150kV grids.
- For Wallonia, a political agreement exists for a reduction of the public service obligation tariff:
  - In accordance with Article 42 bis, §5 of the Walloon Electricity Decree, a partial (85%) exemption from the first component of the Walloon green certificates levy is granted to the final customers with a sector agreement, regardless of the level of consumption. These final customers pay on these exonerated volumes the second component of the Walloon green certificates levy.
  - If the surpluses from the levy collected by Elia and referred to in Article 42 bis, §1 of the Walloon Electricity Decree do not cover all or some of the amounts to be refunded by the local transmission system operator, Elia has to defer payment of the refunds in question, in accordance with Article 42 bis, §8, para. 3 of the Decree. Accordingly, the payment due date depends on the subsequent observation that the levy has returned to a surplus position. This is currently the situation, the exemption is not being refunded by Elia, although the amounts are due and can be taken into account for accounting purposes.
Benchmark methodology

Electricity taxes (1/2)

• For the CSPE (Contribution au Service Public de l’Electricité) in France, we assume that all companies are electro-intensive and exposed to international competition and carbon leakage and thus pay a tariff of 1€/MWh. Please note that this tariff can be lower for hyper-electro-intensive companies (down to 0,5 €/MWh) or (much) higher for non-exposed or non-electro-intensive companies (up to 7,5 €/MWh).

• Criteria to be eligible for a 1€/MWh rate are:
  – CSPE (in its standard rate) is at least 0,5% of the added value created by the consumers
  – Consumer has an important risk for carbon leakage due to indirect emission costs
  – Electric consumption is at least 3kWh per € of added value created by the consumers
Benchmark methodology
Electricity taxes (2/2)

• For the Netherlands it is assumed that an ‘Energie akkoord’ is signed.

• For Germany we assumed that:
  o A reduced EEG-Umlage applies with a floor of 1 EUR/MWh (i.e. consumer qualifies as electricity intensive)
    • Exemption criterion is that the ratio of electricity costs to gross value added at factor costs amounts to 17% or 20%, depending on the sector in which the consumer has its activities
  o A reduced KWK-Umlage of 0,5€/MWh applies for the consumption beyond 1000MWh
    • Exemption criterion is that annual consumption >100MWh and that the ratio electricity cost versus revenue > 4%
  o A reduced StromNEV-Umlage of 0,25€/MWh applies for the consumption beyond 1000MWh
    • Exemption criterion is that the ratio electricity cost versus revenue > 4%
  o A reduced Offshore-Umlage of 0,24€/MWh applies for the consumption beyond 1000MWh
    • Exemption criterion is that the ratio electricity cost versus revenue > 4%
  o That the reduced tariff for the Konzessionabgabe is not considered as it is only applicable for Mittelspannung
Components of Electricity taxes (1/4)

Flanders

In Flanders the following federal and regional taxes and levies are currently applicable:

• The federal contribution which raises money to:
  o Cover the costs related to the CREG (Belgian regulator for energy market)
  o Fund the decommissioning of the Mol-Dessel nuclear site
  o Support policies to reduce greenhouse gases in line with Kyoto
  o Fund public service obligations related to energy deliveries to financially vulnerable consumers
  o Fund a heating premium for an allowance to eligible consumers

• Federal offshore wind contributions (cable and certificates)
• Regional contribution to purchase Green (GSC) and Cogen (WKK) certificates at guaranteed minimum prices

• Regional public service contributions including:
  o Tax on pylons and trenches
  o Levy for the support of renewable energy

• Federal levy for holding and maintaining a strategic reserve capacity
• Regional energy tax, which is mainly used for financing of the green certificates
Components of Electricity taxes (2/4)

**Wallonia**

In Wallonia the following federal and regional taxes and levies are identified:

- The federal contribution which raises money to:
  - Cover the costs related to the CREG (Belgian regulator for energy market)
  - Fund the decommissioning of the Mol-Dessel nuclear site
  - Support policies to reduce greenhouse gases in line with Kyoto
  - Fund public service obligations related to energy deliveries to financially vulnerable consumers
  - Fund a heating premium for an allowance to eligible consumers
- Federal offshore wind contribution (cable and certificates)
- Regional contribution to purchase Green certificates (CV)
- Regional contribution to connect to the transport system (Redevance de raccordement au réseau)
- Regional public service contributions:
  - Tax for the use of public property in Wallonia
  - Levy for the support of renewable energy, including the first term (85% reduction assumed to be applicable) and the second term
- Federal levy for holding and maintaining a strategic generation capacity
Components of Electricity taxes (3/4)

France

In France the following federal and regional taxes and levies are identified:

• CTA: the “Contribution Tarifaire d’Acheminement”. This contribution depends on the network costs. As the network costs depend on the type of profile, this contribution is different for baseload and peak load profiles. It is the only component of the taxes that depends on the type of profile.

• CSPE: the “Contribution au Service Public de l’Electricité” has to cover the costs of the public service assignments (development of renewable power generation, of the social electricity tariffs and of the nationwide harmonization of electricity tariffs).

• As from 01/01/2016, the TICFE (“Taxe intérieure sur la consommation finale d’électricité”) has been integrated in the CSPE.
Components of Electricity taxes (4/4)

**Germany**

In Germany the following federal and regional taxes and levies are identified:

- Stromsteuer: general tax on energy consumption.
- Konzessionablage consists of a concession fee to local authorities (communes) that is due for low and medium voltage connections.
- EEG-Umlage intends to increase the market penetration of electricity produced from renewable energy in accordance with the Renewable Energy Act.
- KWK-Umlage intends to promote electricity produced from combined heat and power (CHP) plants, according to the Combined Heat and Power Act.
- StromNEV-Umlage: electricity grid charge compensating the lost revenue from TSOs that need to apply the grid fee exemptions.
- Offshore-Haftungsumlage finances the costs relating to Germany's shift from nuclear to green energies.
- Umlage abschaltenbaren Lasten: tax levied for the cost related to interruptibility payments. Exceptionally, no tax was levied in 2016.

**The Netherlands**

In the Netherlands the following federal and regional taxes and levies are identified:

- The Regulerende Energie Belasting (REB) is a tax which intends to improve the rational use of energy.
- The ODE tax (Wet Opslag Duurzame Energie) is a tax that is intended to finance the support for the production of renewable energy.
Compensation for indirect emissions
Impact on electricity costs

The countries in scope of the study, Germany, the Netherlands, Flanders and (since 2015) France have introduced a compensation scheme for carbon leakage activities, while Wallonia does not provide compensations (but is considering doing so in the near future). The approved schemes need clearance from the European Commission and have to satisfy a certain number of strict criteria. Although the compensation mechanisms in these countries converge largely, it is not possible to calculate the specific impact on the electricity cost for the defined consumer profiles without further and very detailed assumptions. The impact is therefore not included in the results of the benchmarking study.

From a high level perspective and for those activities that can benefit from the compensation, the impact of the compensation on the electricity price in Flanders, Germany the Netherlands and (since 2015) France can be estimated at approximately 3-4 €/MWh for 2015, 3.5-4.5 €/MWh for 2016 and 2.5-3.5 €/MWh for 2017.

Impact Indirect emissions compensation on all-in electricity price
(base load (100 GWh))
